

PlayerOne Final Project Planning

Hardest part would be user authentication and authorization

The most challenging aspect of this project will be implementing secure user authentication and authorization. This process involves validating users' identities and ensuring that only authorized individuals (players, coaches, etc.) can access specific data.

Theme

Is based on Sports Management system, mainly focusing on player metrics, coach, player information and Teams,

Main goal is creating an easy platform for players to access to player metrics, either by players viewing there day to day game number or overall, by coaches and MD's.

Read and Write procedures

Read procedures would retrieve all data from all the Four tables in the PlayerOne database

Modification procedure would be able to add data into the player metrics table

View layer

I will be implementing Python Tkinter.

README

Yes, a README file will be included.

Testing Process:

- **Unit Testing:** Write unit tests for the SQL queries and Python functions to ensure they execute correctly.
- **Integration Testing:** Test the integration between the database and the Tkinter application to verify that data is being correctly fetched, displayed, and modified.
- **User Acceptance Testing (UAT):** Test the interface with end-users (e.g., a coach and a player) to ensure usability.
- **Database Testing:** Test for SQL injection vulnerabilities and ensure that stored data adheres to constraints (e.g., player age, metric ranges).

Project Timeline:

Stage	Notes
Project Planning	Submit planning document and initial design.
Database Design & ERD	Create ERD, finalize table relationships.
Database Setup & Testing	Create tables, insert sample data, test procedures.
Create Data Access, Business Logic and View Layer	Develop UI for players, coaches, and MDS.
Functionality Testing	Test database functions and UI.
Final Submission	Submit the final project.
